All data is at 20°C coil temperature. Force (torque) outputs degrade with elevated temperatures.

- <sup>1</sup> Gross starting torques are shown. For net available starting torque, subtract return spring torque of 20.3 mNm ±20%.
- <sup>2</sup> Holding torque is shown at the stabilised temperature of 105°C and continuous duty.
- \* Consult factory.

## How to Order

- Using the Performance Chart to the left, select one of the five columns which provides the appropriate duty cycle for your application. Reading down this column locate the torque for the stroke you need. For net available starting torque, subtract return spring torque of 20.3 mNm ±20% (if torque is insufficient go to next larger solenoid size).
- Use the chart below to select the model number corresponding to your desired design, stroke and direction of rotation (as viewed from armature end, opposite mounting studs).
- Using the Specification Chart to the right, select the same duty cycle column. Follow down the column into the VDC ratings. Select the voltage which most closely matches your supply voltage. Read across to the left to select the coil awg suffix.
- Replace the last two digits of the model number (XX) with the coil awg number to complete the part number.
